

Case Ref: DNA 1111
Date: 24 July 2019

PRENATAL DNA TEST REPORT

Potential Father: Tom Smith

Name of Mother: Lucy Smith

POTENTIAL FATHER	PROBABILITY OF PATERNITY
Tom Smith	>99.9%

Statement

A comparison of the DNA profiles of Tom Smith and the foetal DNA profile obtained from Lucy Smith's blood sample supports the hypothesis that Tom Smith is the biological father of the foetus. It is 4,500 times more likely that Tom Smith is the true biological father of the foetus than another unrelated man from the same population.

The results obtained are consistent with the foetus inheriting DNA markers of the same size from the alleged father.

All tests are performed assuming a close male relative is not a potential father unless this information is provided prior to testing. In cases where a close male relative of the tested man could be a potential father to the child it is recommended that where possible any such relative is tested.

As this is a Peace of Mind test all testing has been performed based on information provided by the client. The identity of the sample donors and the chain of custody of the samples cannot be guaranteed; therefore these results are not court admissible.

Conclusion

This result provides strong support in favour of paternity.
